01 / Solution architecture

System components, data flows, trust boundaries and the separation of model recommendations from deterministic authority.

Baseline: commit bec87e8 | ADK 2.12.0+remedi.1 (private build) | OpenTelemetry API/SDK 1.45.1 | 26 Oct 2026

02 / Technical deployment + CI/CD

Hosted Linux validation and gated Windows deployment to Docker Desktop, with SHA-tagged images, health checks and rollback.

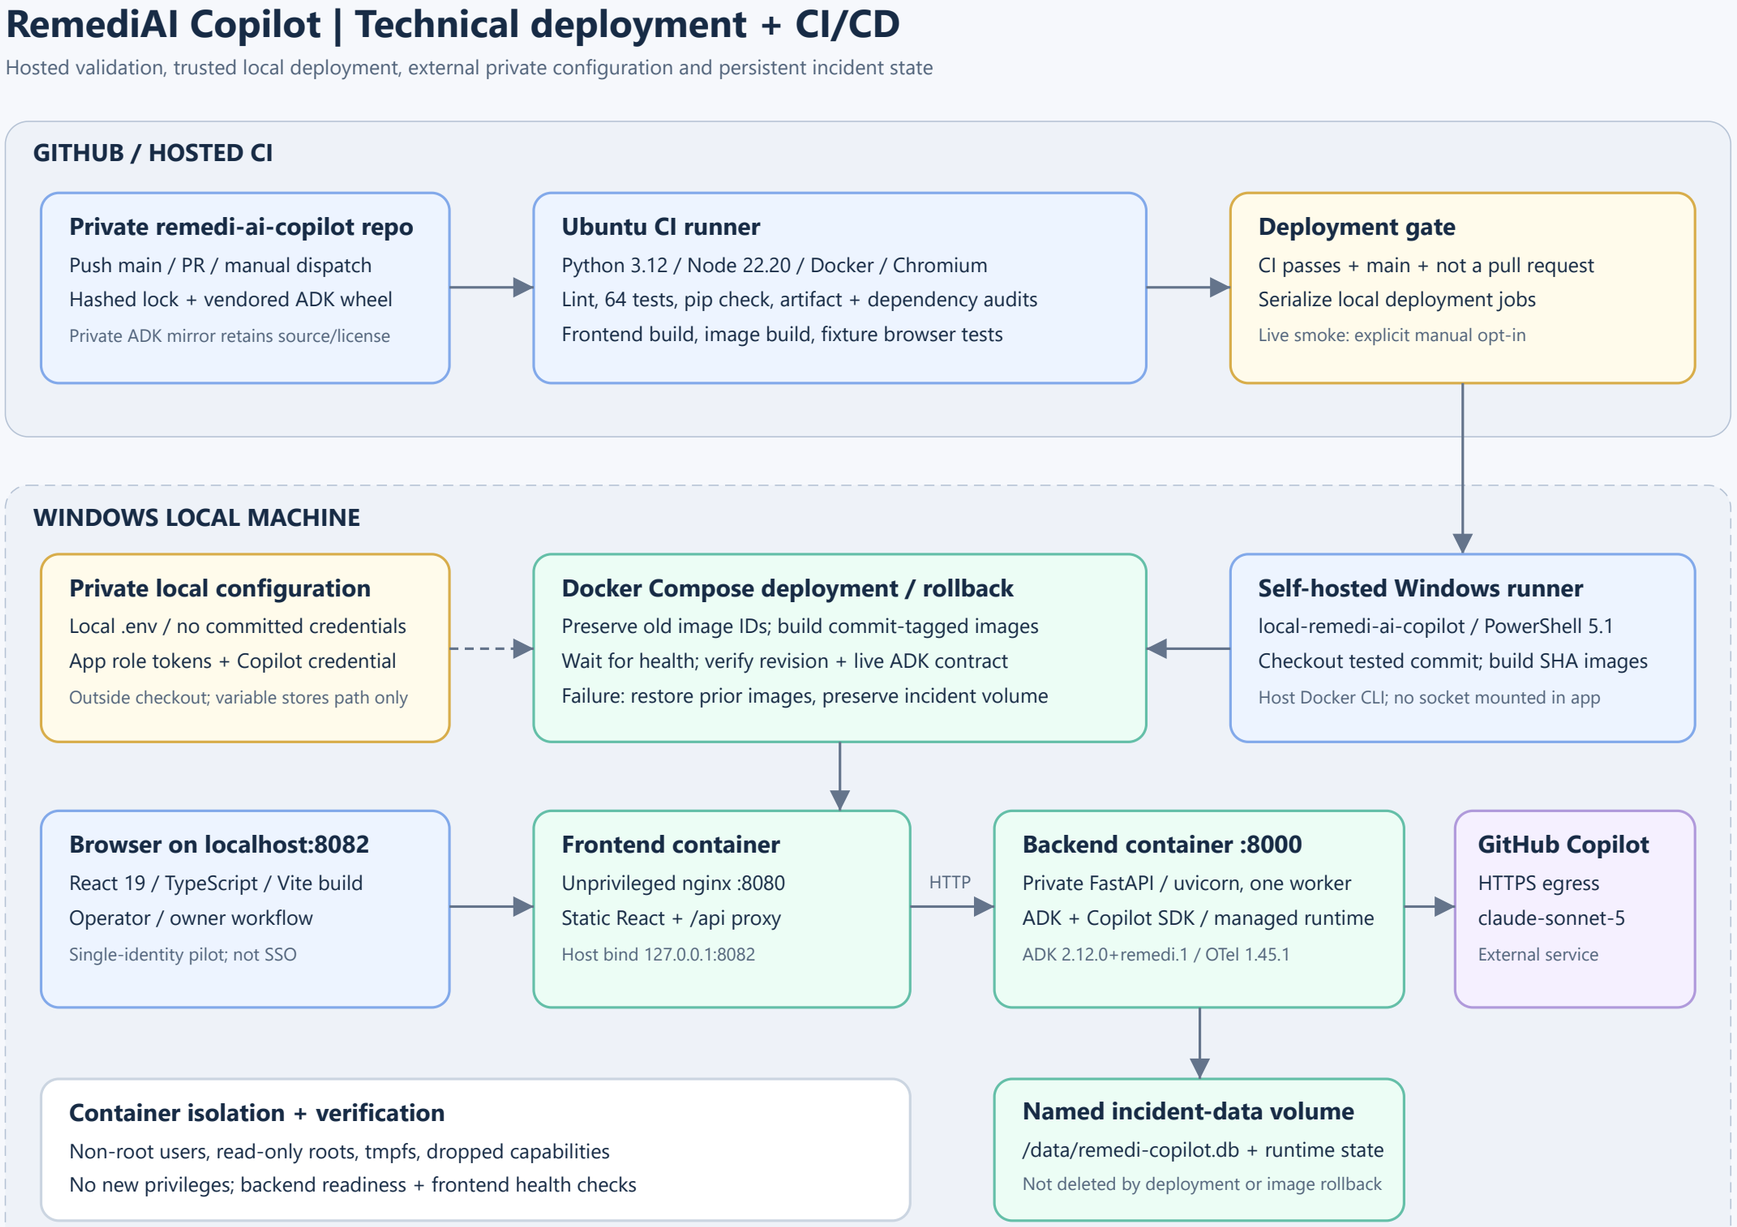

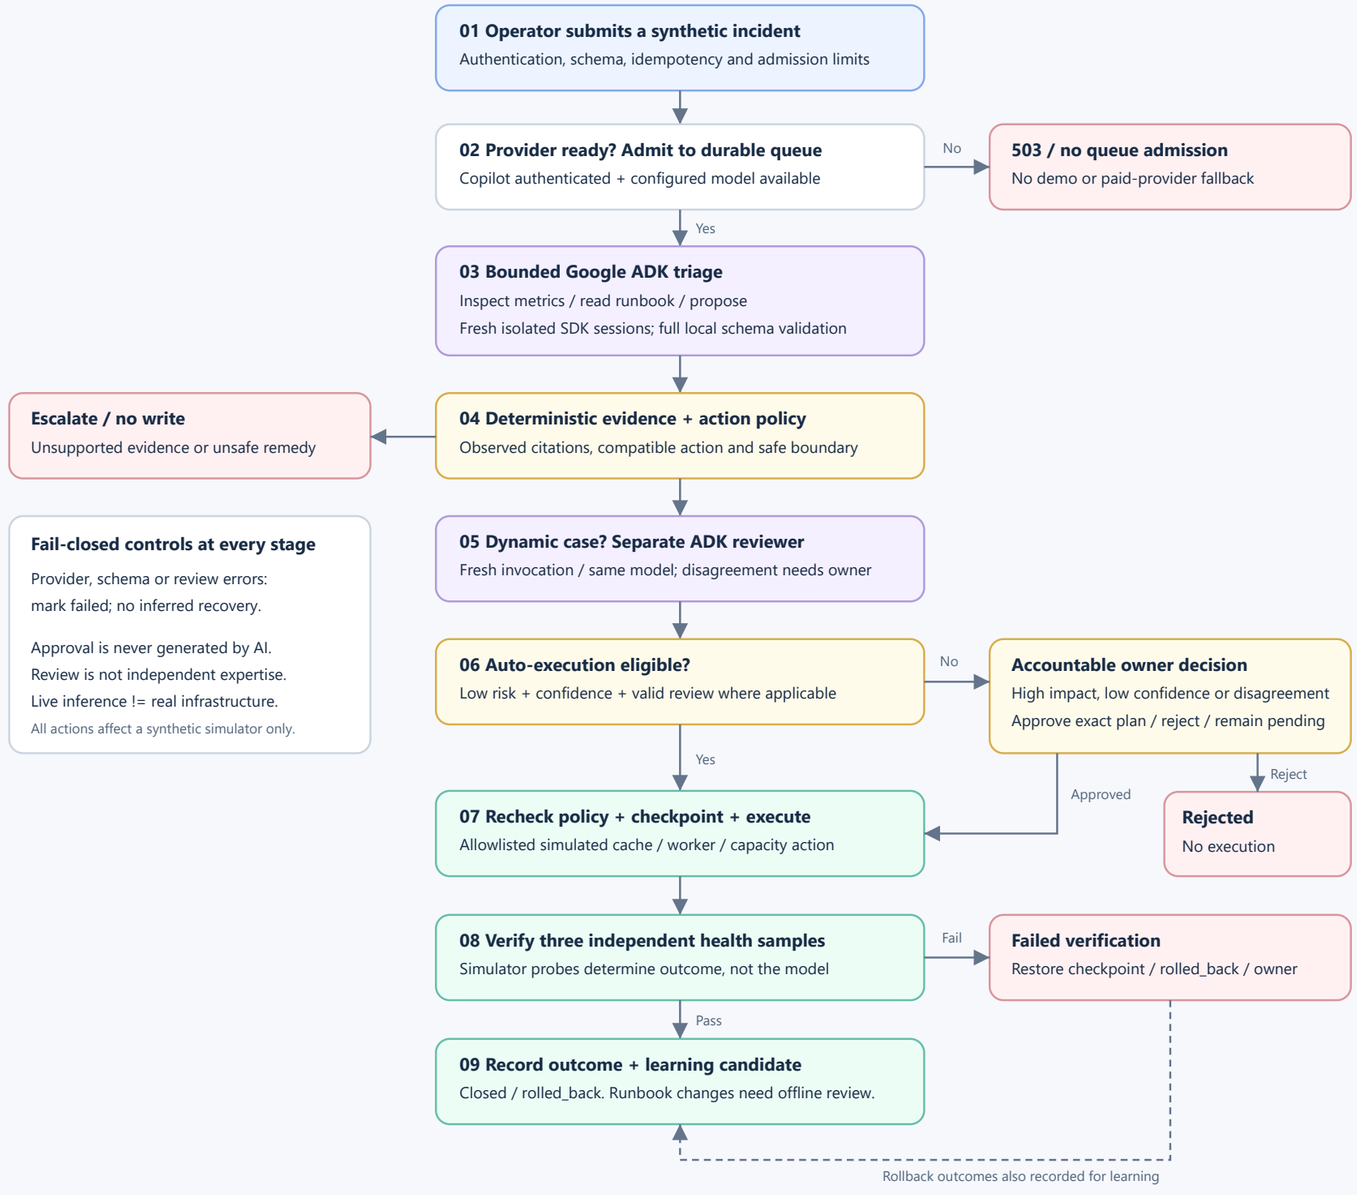

Image rollback is not database rollback. CI fixtures are not live inference. App containers never receive the host Docker socket.

03 / Governed incident workflow

Evidence-based triage, optional reviewer, owner approval, simulated execution, independent recovery verification and reviewed learning.

Aligns to AI_Remedy_1 / AI_Remedy_2: triage, approved risk boundary, human gate, execute, verify, rollback and learn.
